

PIONIER and the massive stars

Hugues Sana
Space Telescope Science Institute

In collaboration with: **J.-B. Le Bouquin, S. Lacour, O. Absil, J.-P. Berger, M. De Becker, A. De Koter, K. Kratter, L. Gauchet, E. Gosset, B. Lazareff, L. Mahy, B. Norris, J. Olofsson, D. Pickel, O. Schnurr, H. Zinnecker, G. Zins**

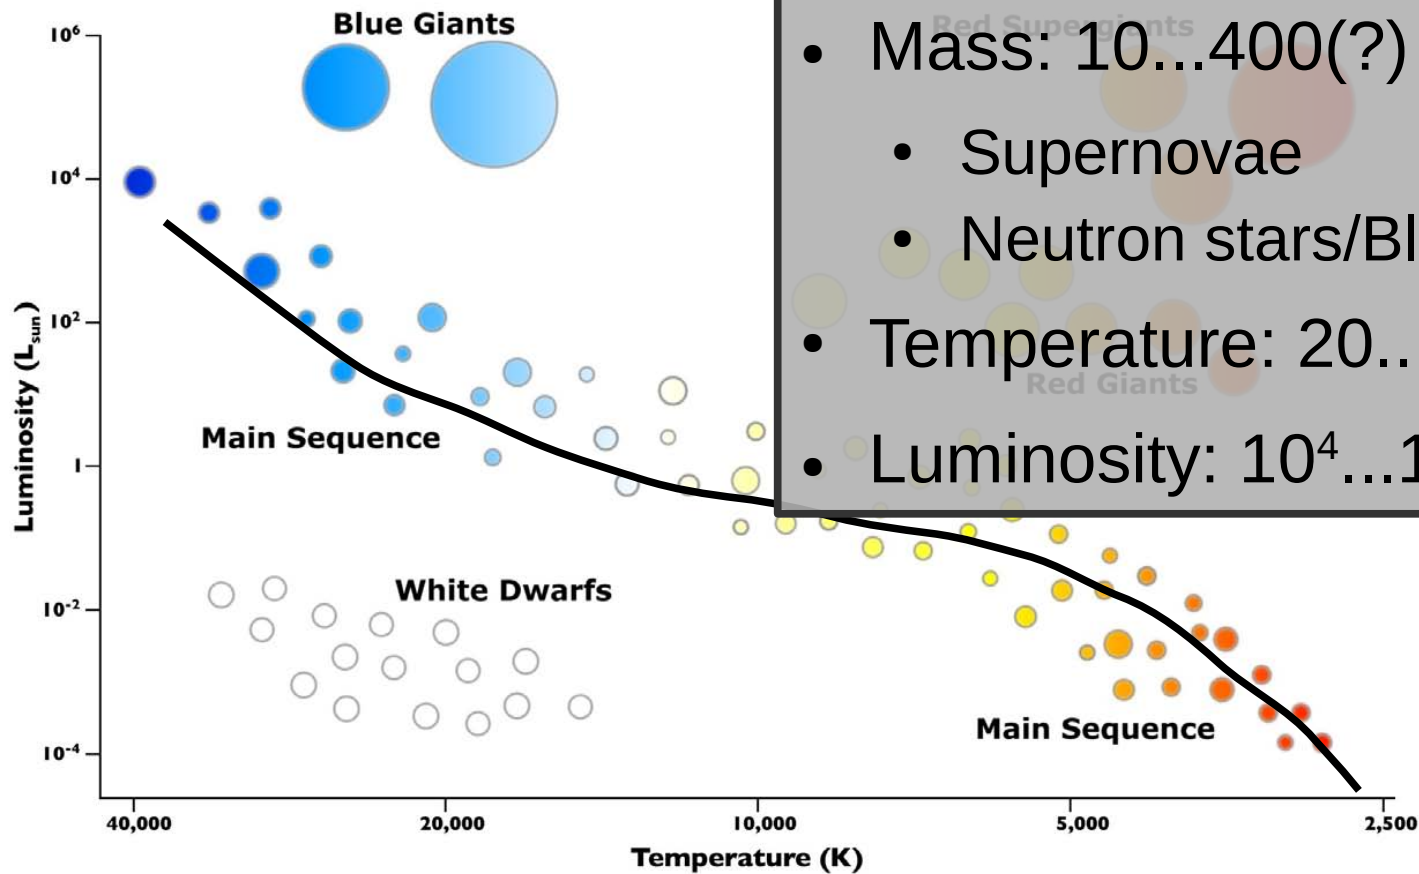

Storyboard

- Introduction to massive stars
 - Their role in the Universe & in astrophysics
 - Open questions
- Massive star formation
 - The SMaSH+ survey (a PIONIER large program)
- Massive star evolution
 - Towards accurate mass determination
 - Colliding wind binaries

Hertzsprung-Russell diagram

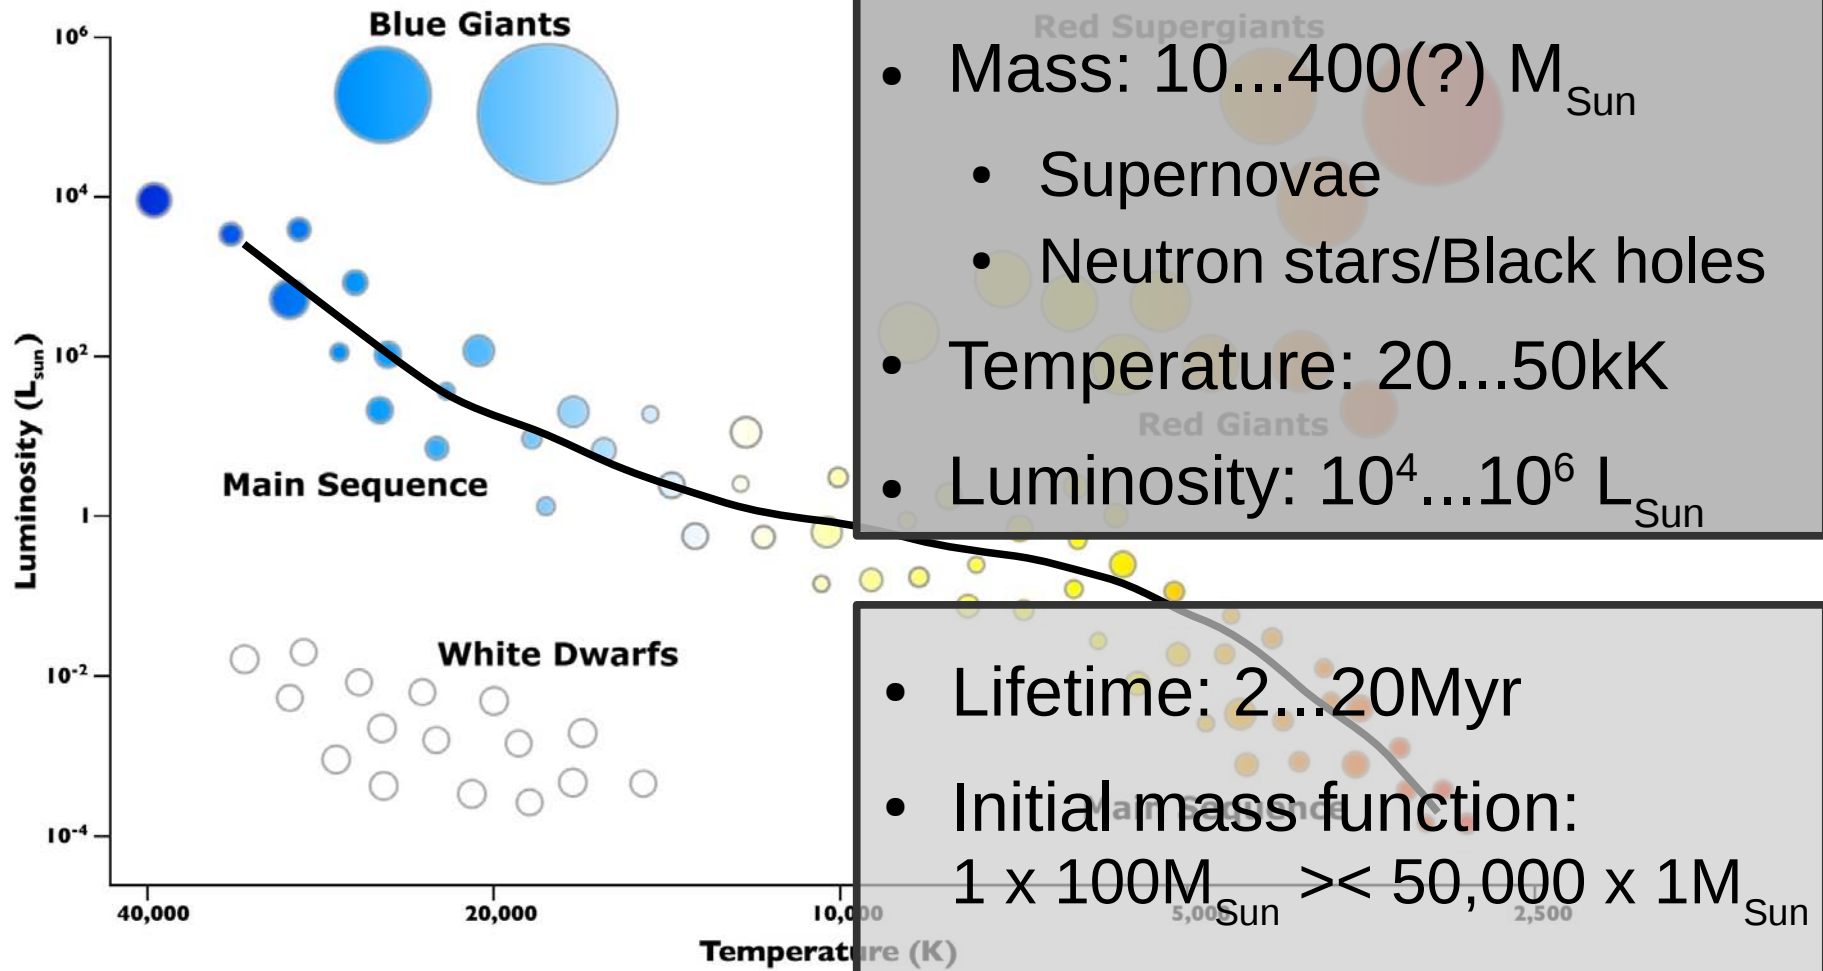

Hertzsprung-Russell diagram

- Mass: $10 \dots 400(?) M_{\text{Sun}}$
 - Supernovae
 - Neutron stars/Black holes
- Temperature: $20 \dots 50 \text{ kK}$
- Luminosity: $10^4 \dots 10^6 L_{\text{Sun}}$

Hertzsprung-Russell diagram

- Mass: $10 \dots 400(?) M_{\text{Sun}}$
 - Supernovae
 - Neutron stars/Black holes
- Temperature: $20 \dots 50 \text{ kK}$
- Luminosity: $10^4 \dots 10^6 L_{\text{Sun}}$

- Lifetime: $2 \dots 20 \text{ Myr}$
- Initial mass function:
 $1 \times 100 M_{\text{Sun}} \gg 50,000 \times 1 M_{\text{Sun}}$

Massive stars matter in the Universe

- Strong ionizing flux
- Large radiation and momentum input
- Main source of heavy elements

First stars

Energy

Chemistry

The Periodic Table

1 H																	2 He

... *COSMIC ENGINES*

Massive stars matter in the Universe

Star formation

Cosmol. medium

So bright that ...

- Populations of massive stars
- SN and GRBs

... can be seen throughout the Universe

... *COSMIC CANDLES*

Massive stars matter in the Universe

Progenitors of

- Neutron stars
- Black holes
- Double compact objects
NS+NS / NS+BH / BH+BH

Potential source of

- Gravitational wave
- Several 10s to 1000s of events
per year? (2016-2018)

Compact objects

... EXTREME PHYSICS

How massive stars form is a mystery

- Complex problem
- Time/space scales
- Observational challenges

- Theoretical challenges
 - Accretion rate
 - Luminosity barrier
 - Angular momentum

Massive star evolution

Traditional view
as single star

- Mass & mass-loss
- Metallicity
- Rotation rate

Key parameters

A high fraction of close binaries

Most massive stars are born
as part of a
close binary system

→ Fundamental aspect of formation

• Sana+ 2012

A high fraction of close binaries

Most massive stars are born
as part of a
close binary system

→ Fundamental aspect of formation

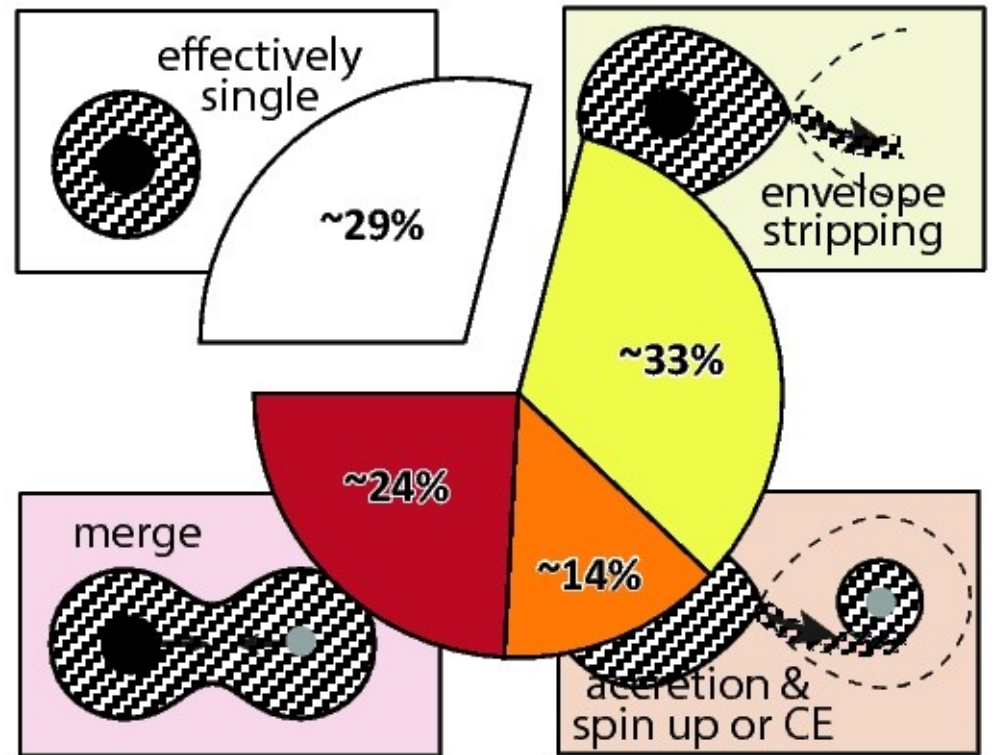

Almost all massive stars
interact with a companion

→ Fundamental aspect of evolution

• Sana+ 2012

Binary interaction

Binary interaction dominates the evolution of massive stars

Sana+ 2012, Science

Binary interaction

Binary interaction dominates the evolution of massive stars

Final fate

- Lifetime
- Evolutionary path
- Final explosions

Population properties

- Age
- Colour & ionizing flux
- Mass function
- Rotation rates

Sana+ 2012, Science

Statistical
properties

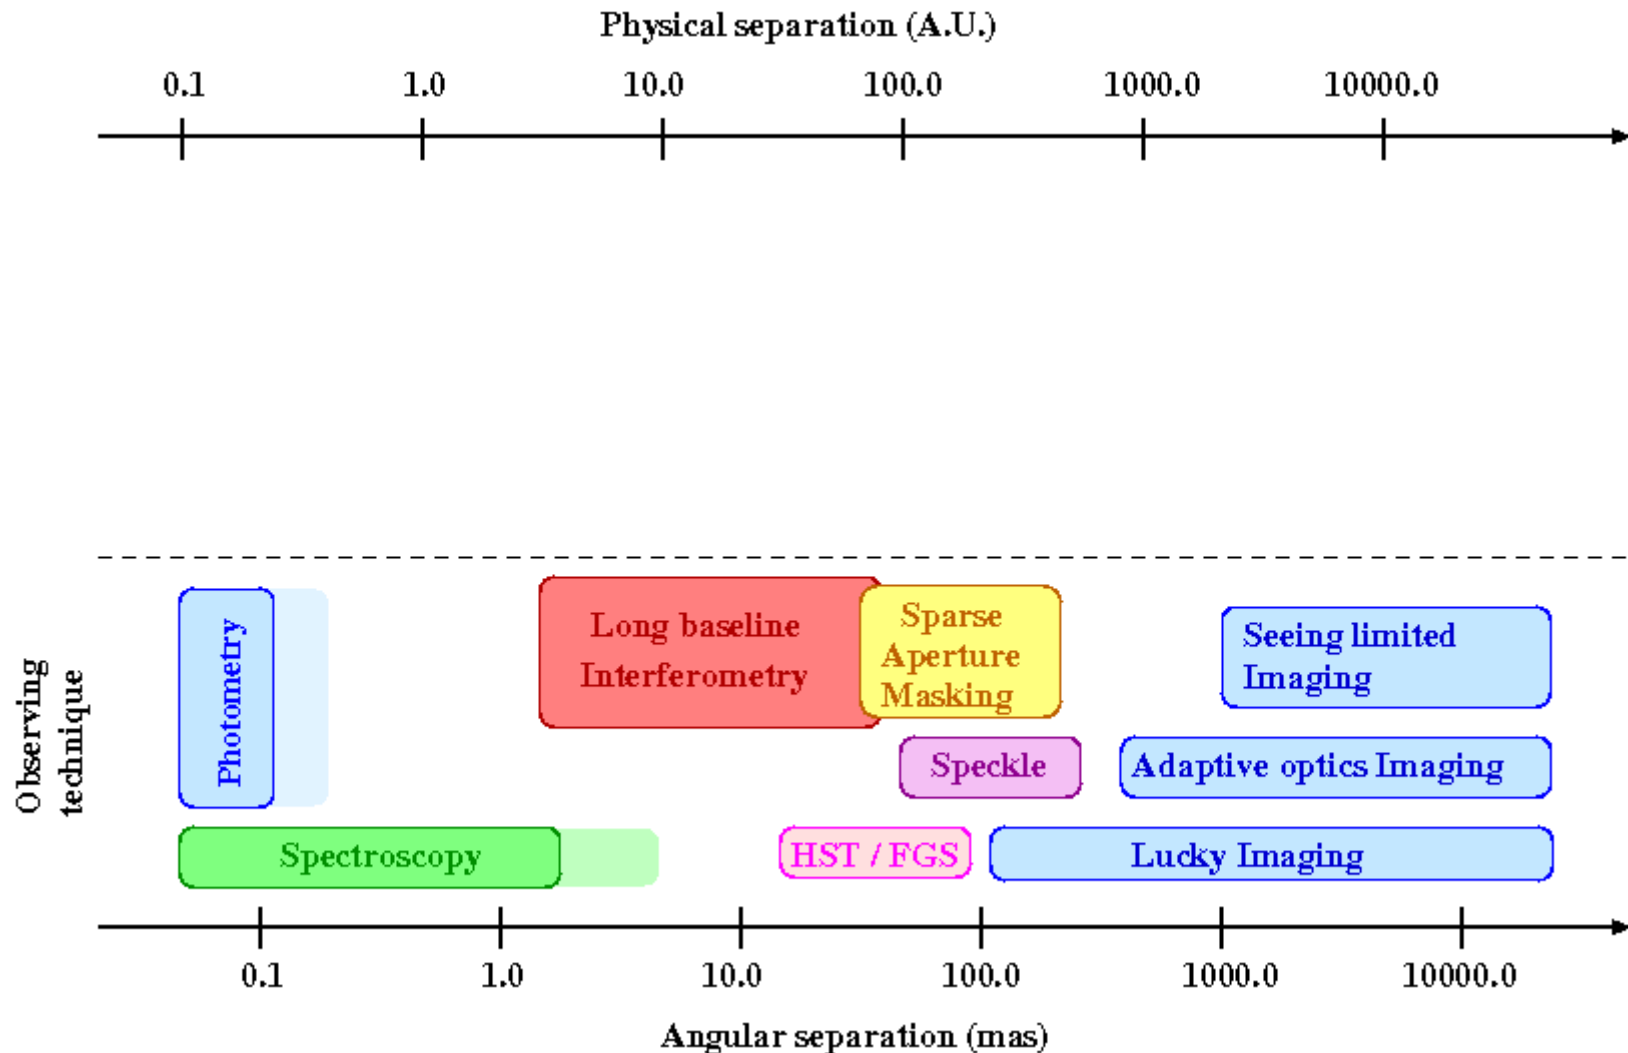

Galactic O-type binaries

- Mason et al. 2009 (~400 O stars)
 - 55% SB; 43% VB --> 75% have SB or VB companion
- Sana et al. 2012: 56% SB --> 69% (bias corrected)
- Chini et al. 2012: 79% SB (before bias correction)

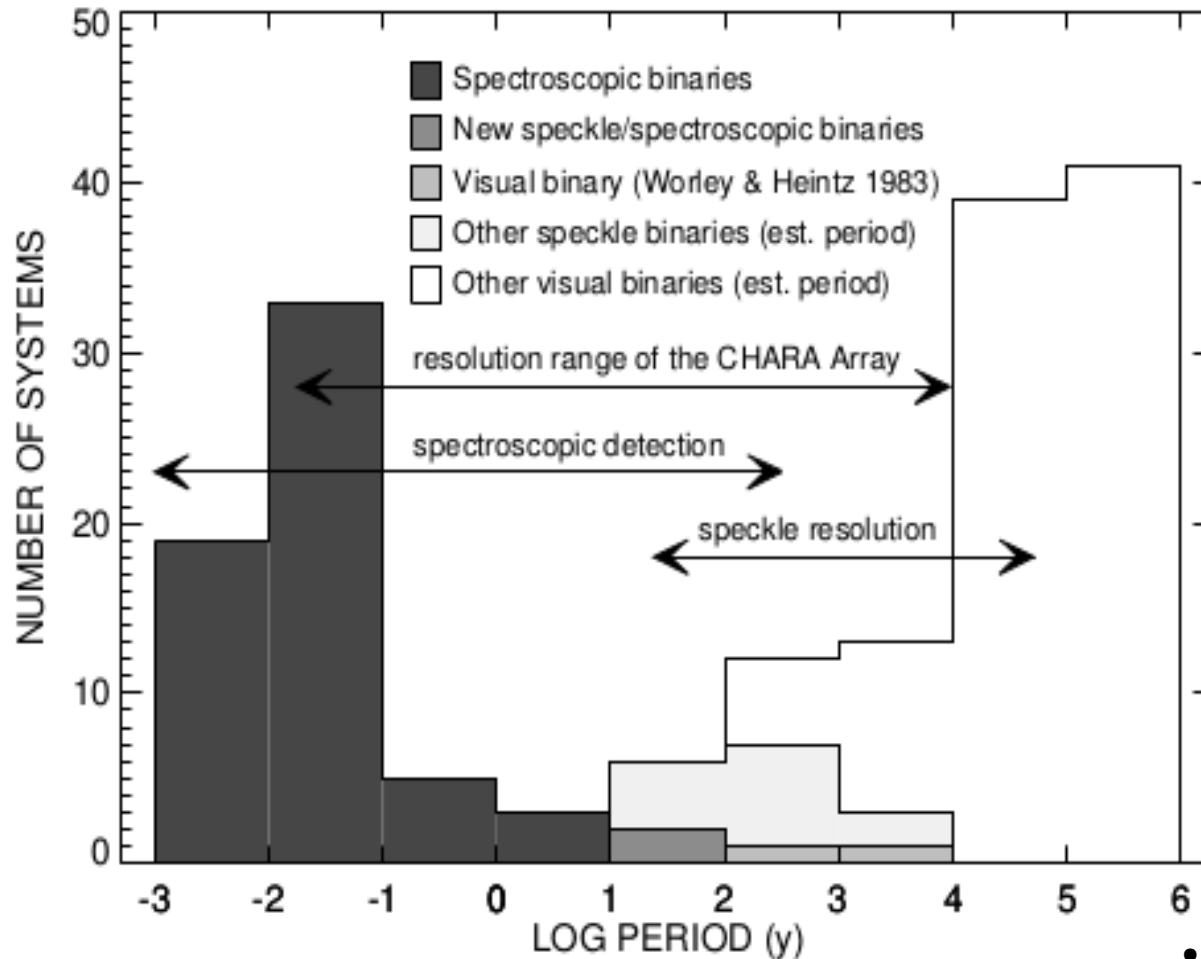

- *The end product of massive star formation is a multiple system*

==> Massive star formation theories can be tested by the multiplicity properties of their end products

Observational techniques

Previous high angular resolution survey

• Mason+ 1998

The SMaSH+ Survey (189.C-0644): Southern Massive Stars at High angular resolution

Long-base line interferometry

- 20 VLT/PIONIER nights

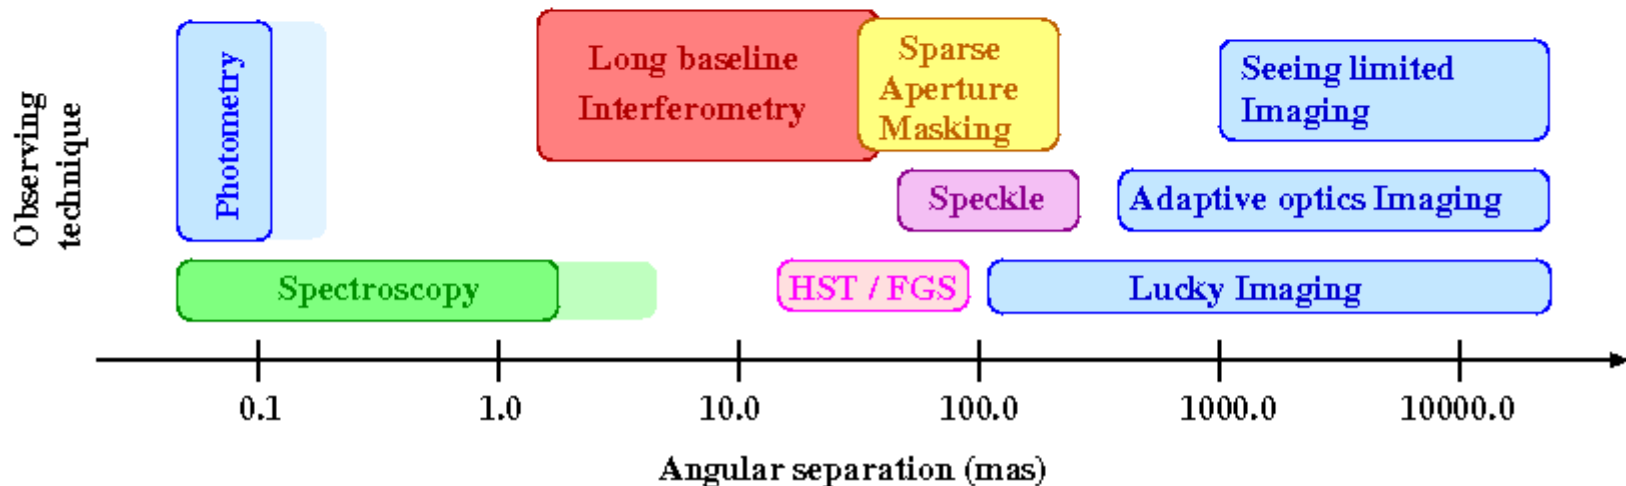

Sparse Aperture Masking

- 13 VLT/NACO nights

Observational goals

- Binary/Multiplicity fraction
- Separation distributions
- Flux ratio distributions

High angular resolution survey

Krumholz+2009

Kratter et al. 2010

Unexplored region of parameter space

- Probes separation ranges expected by **disk fragmentation theories**
- First quantitative **test of massive star formation**

The SMaSH+ survey

Sample selection

- Galactic O star catalogue
- $\delta < 0^\circ$
- $H < 7.5$
- Not Orion

Long-base line interferometry

- 107 O stars

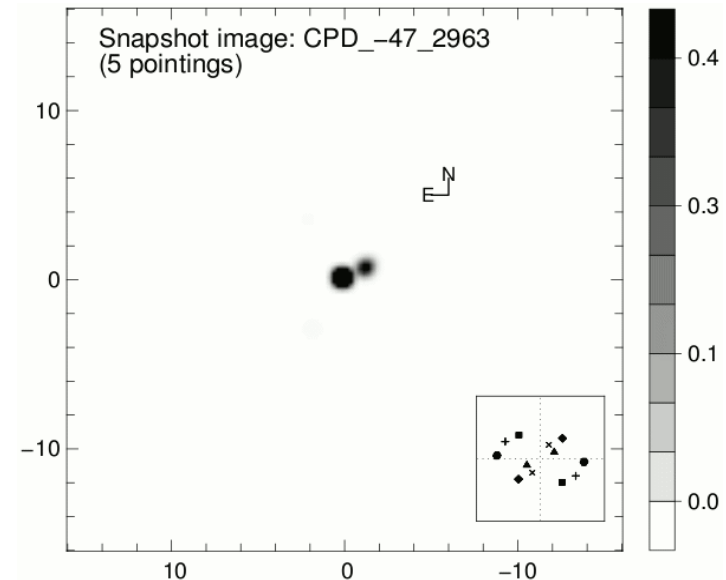

Sparse Aperture Masking

- 165 O stars

VLTI / PIONIER

- $1 < \rho < 50 \text{ mas}$
- $\Delta H < 3.7$

The SMaSH+ survey

Sample selection

- Galactic O star catalogue
- $\text{DEC} < 0^\circ$
- $H < 7.5$
- Not Orion

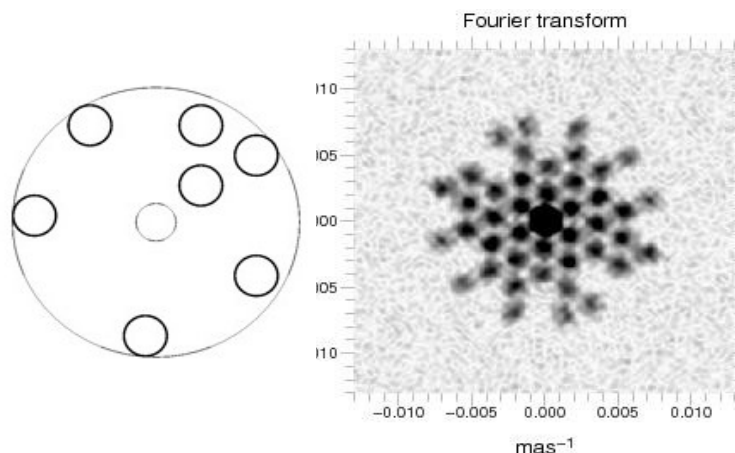

Long-base line interferometry

- 107 O stars

Sparse Aperture Masking

- 165 O stars

Sparse Aperture Masking (NACO/SAM)

- $30 < \rho < 250 \text{ mas}$
- $\Delta H < 5$

The SMaSH+ survey

Sample selection

- Galactic O star catalogue
- $DEC < 0^\circ$
- $H < 7.5$
- Not Orion

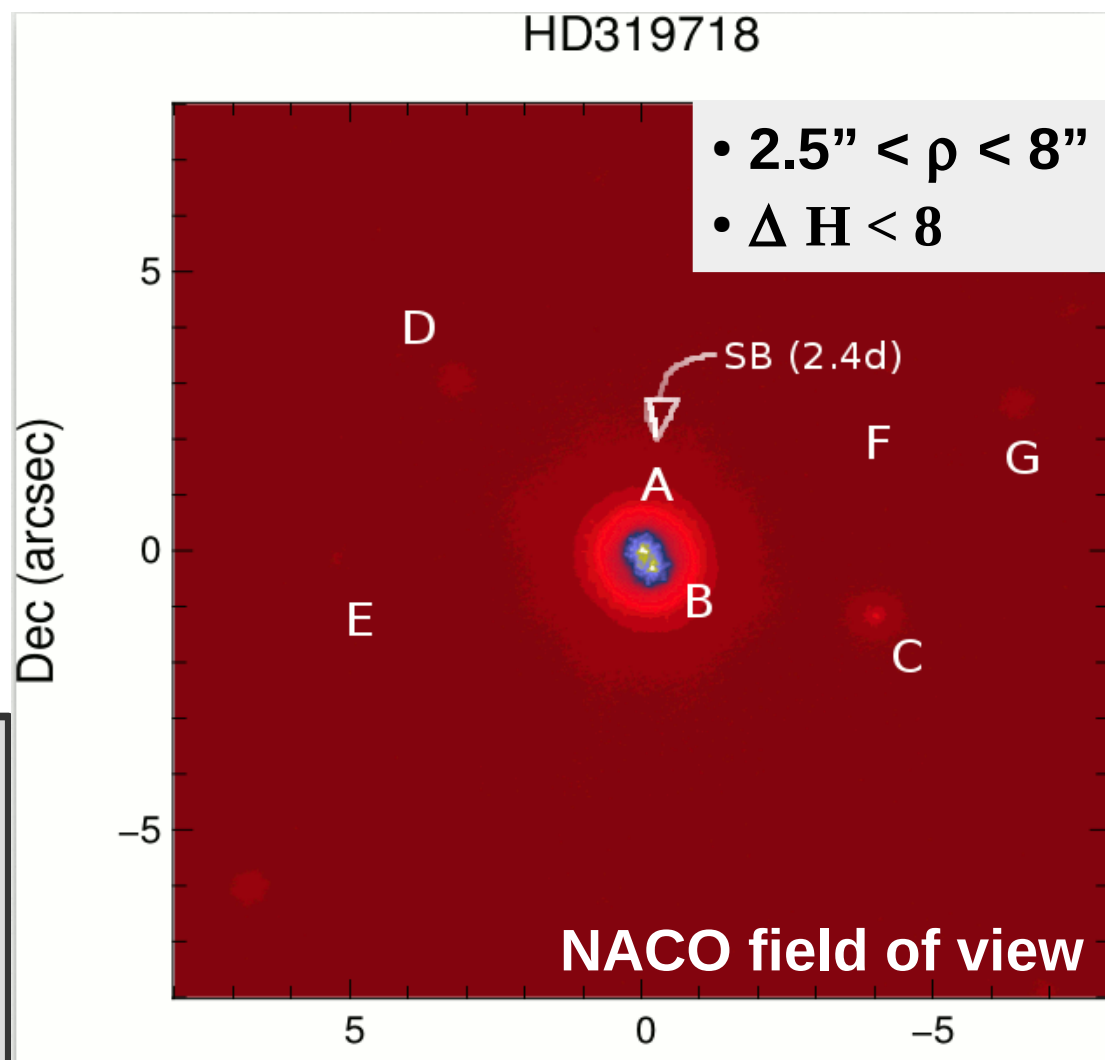

Long-base line interferometry

- 107 O stars

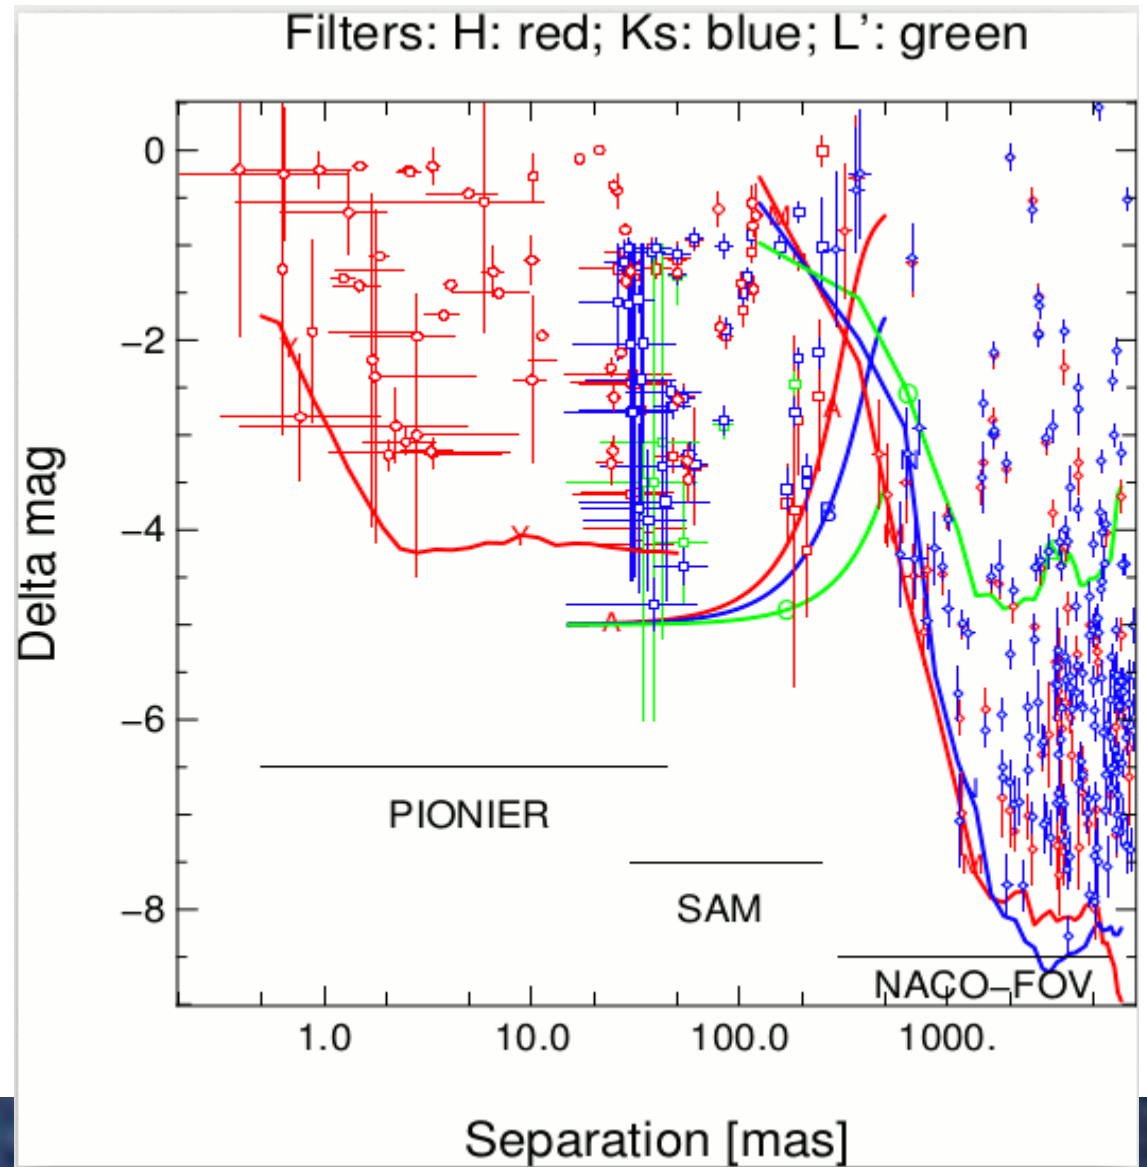

Sparse Aperture Masking

- 165 O stars

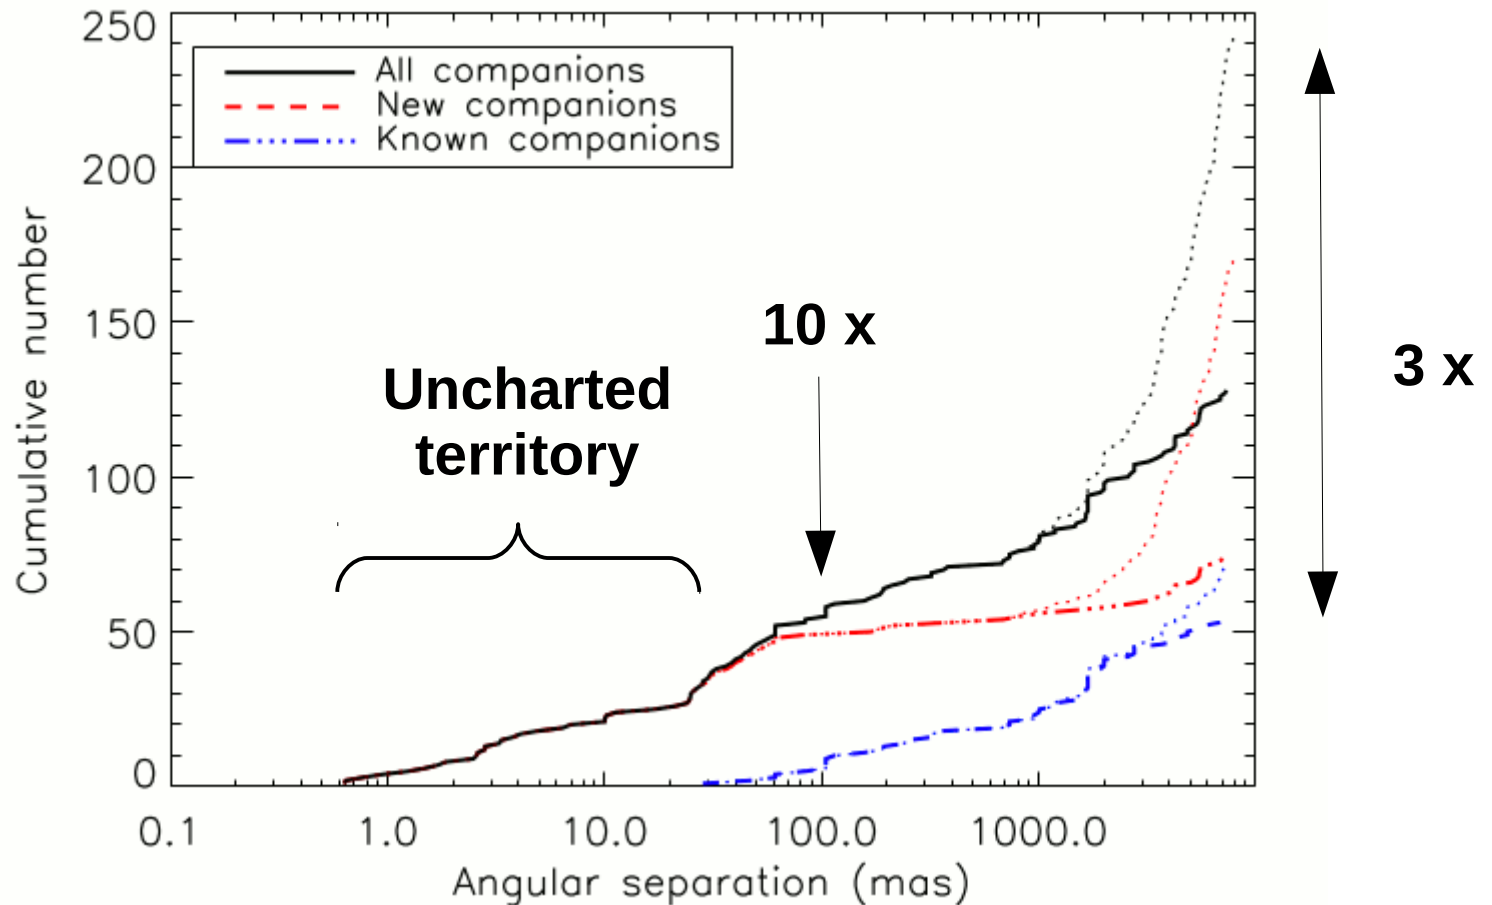

SMaSH+ : early results

246 companions detected

SMaSH+ early results

246 companions detected

SMaSH+: Early results

**Main sample of
V-I O-type stars**

← 82%

← 54%

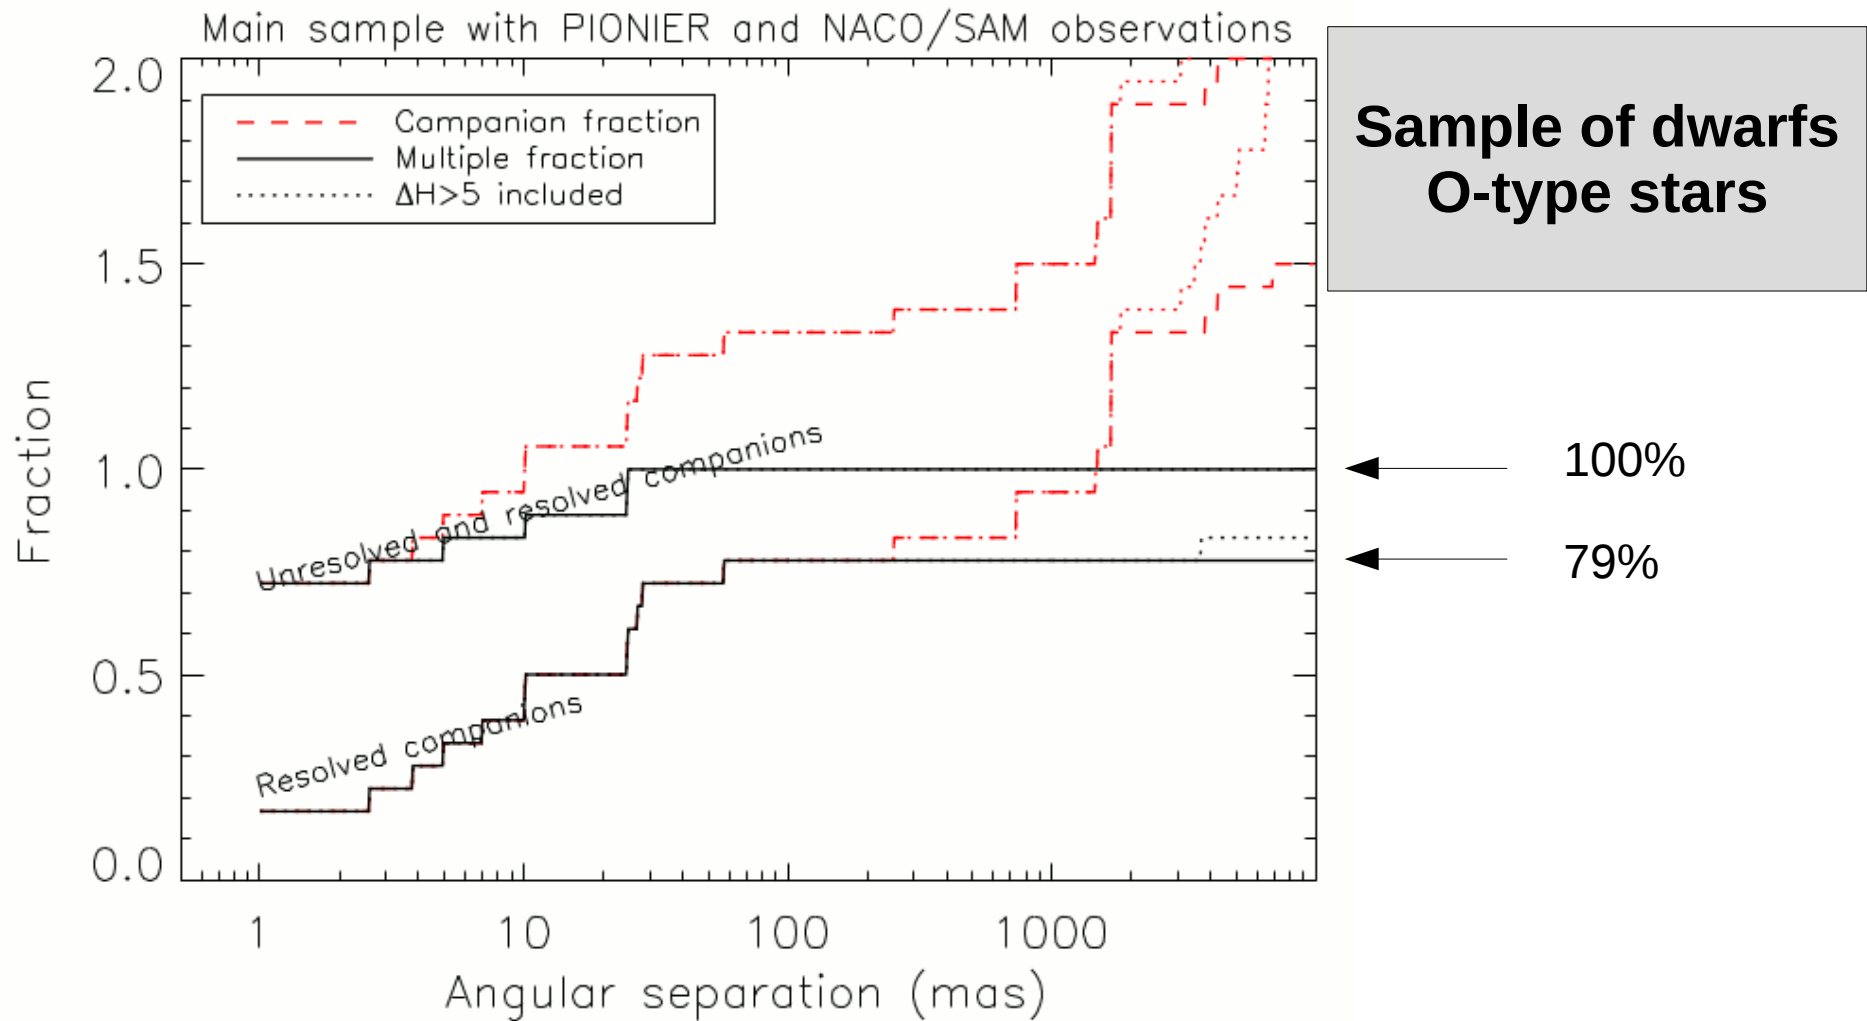

SMaSH+: Early results

**Main sample of
V-I O-type stars**

**Contamination
~20% on average,
i.e. ~0.2 mag**

SMaSH+: Early results

SMaSH+: early results

SMaSH+: early results

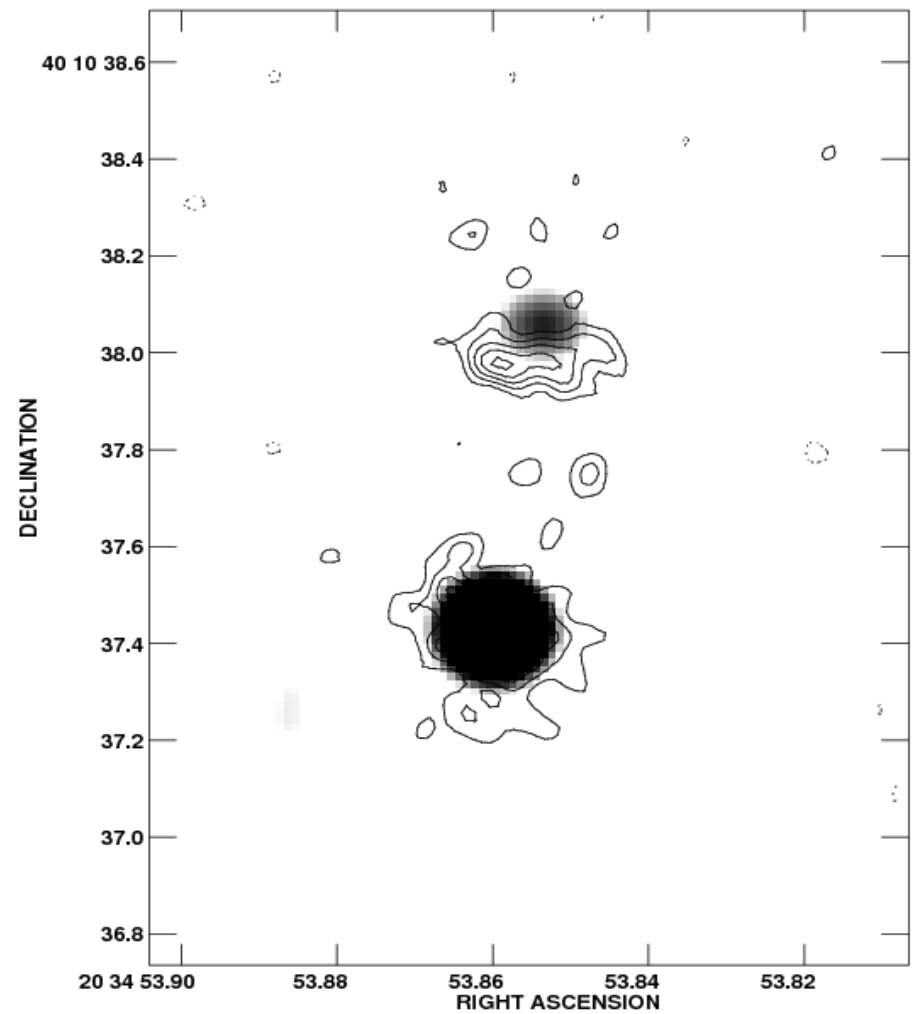

**Early trends
compatible with
disk fragmentation
through gravitational
instabilities**

BUT ...

Non thermal radio emission

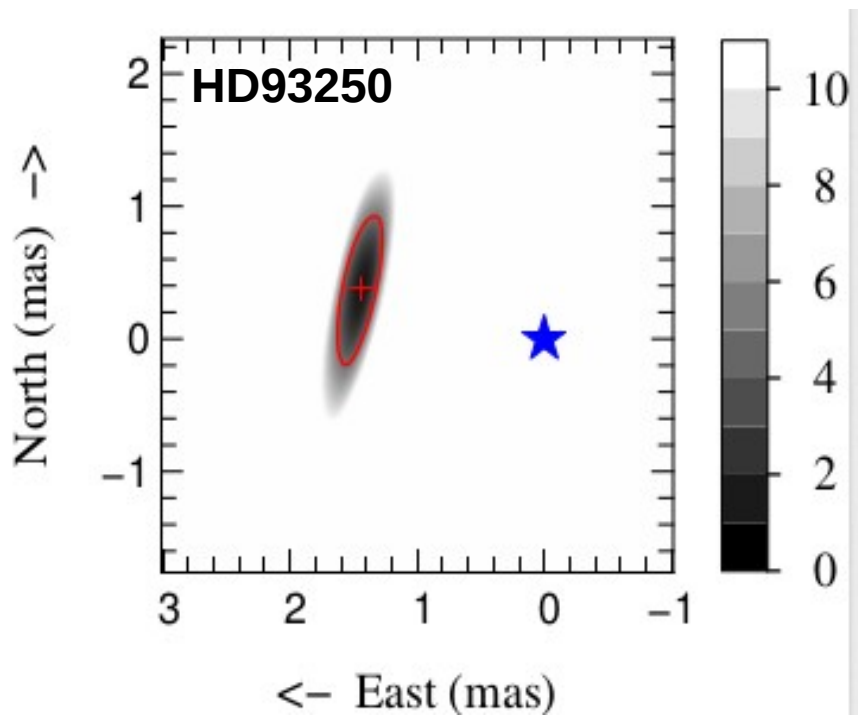

Non thermal radio emission

Non thermal radio emission

- 16 O-type NT radio emitters known (9 with $\delta < 0^\circ$)
- 1/3 have no indication of binarity despite intensive SB search
 - De Becker 2007

- Sana, Le Bouquin+2012

- De Becker+2012

- 16 O-type NT radio emitters known (9 with $d < 0^\circ$)

- 16 O-type NT radio emitters known (9 with $d < 0^\circ$)

Wind-wind collision in wide binaries as the **universal** explanation of the origin of non thermal radio emission

Quantitative work on the way ...

SMaSH+ early results

- > 100 O-type stars observed: 246 companions
- 35% have a companion < 200 mas
- # of companions 10x @ $\rho < 100$; 3x @ $\rho < 8''$
- Multiplicity fraction of O V : $F_{\text{mult}} = 100\% < 100 \text{ mas}$
- F_{mult} decreases for O III and O I (bias ?)
- Hints for different $\Delta\text{mag} - \rho$
- All SB with $P > 150\text{d}$ are resolved
- All non-thermal radio emitters are resolved

Binaries as laboratories

- Eclipsing binaries provide direct measurements of masses, radii & distance
 - 25 masses with accuracy $< 5\%$ (Gies. 2011)

SB period distribution

•Sana & Evans 2011

- 6 candidates with $P > 130 \text{ d}$ identified
- Proof of concept with AMBER + UTs

Binaries as laboratories

Combining interferometry and spectroscopy can help !

Need of $D > 1.5$ kpc to find candidates

- θ^1 Ori C (P~11yr)
- Kraus+ 2009

Binaries as laboratories

Combining interferometry and spectroscopy can help !

Need of $D > 1.5$ kpc to find candidates

SB period distribution

•Sana & Evans 2011

- 6 candidates with $P > 130$ d identified
- Proof of concept with AMBER + UTs

• De Becker, Sana, Le Bouquin+2013

***VLT + spectral disentangling
(+ time)***

accurate mass and distances

• Sana, Le Bouquin+2013

PIONIER offers a new window of investigations for massive stars

- Fundamental parameters
- Wind physics
- SMaSH+: Statistical multiplicity properties in an uncharted range of separations

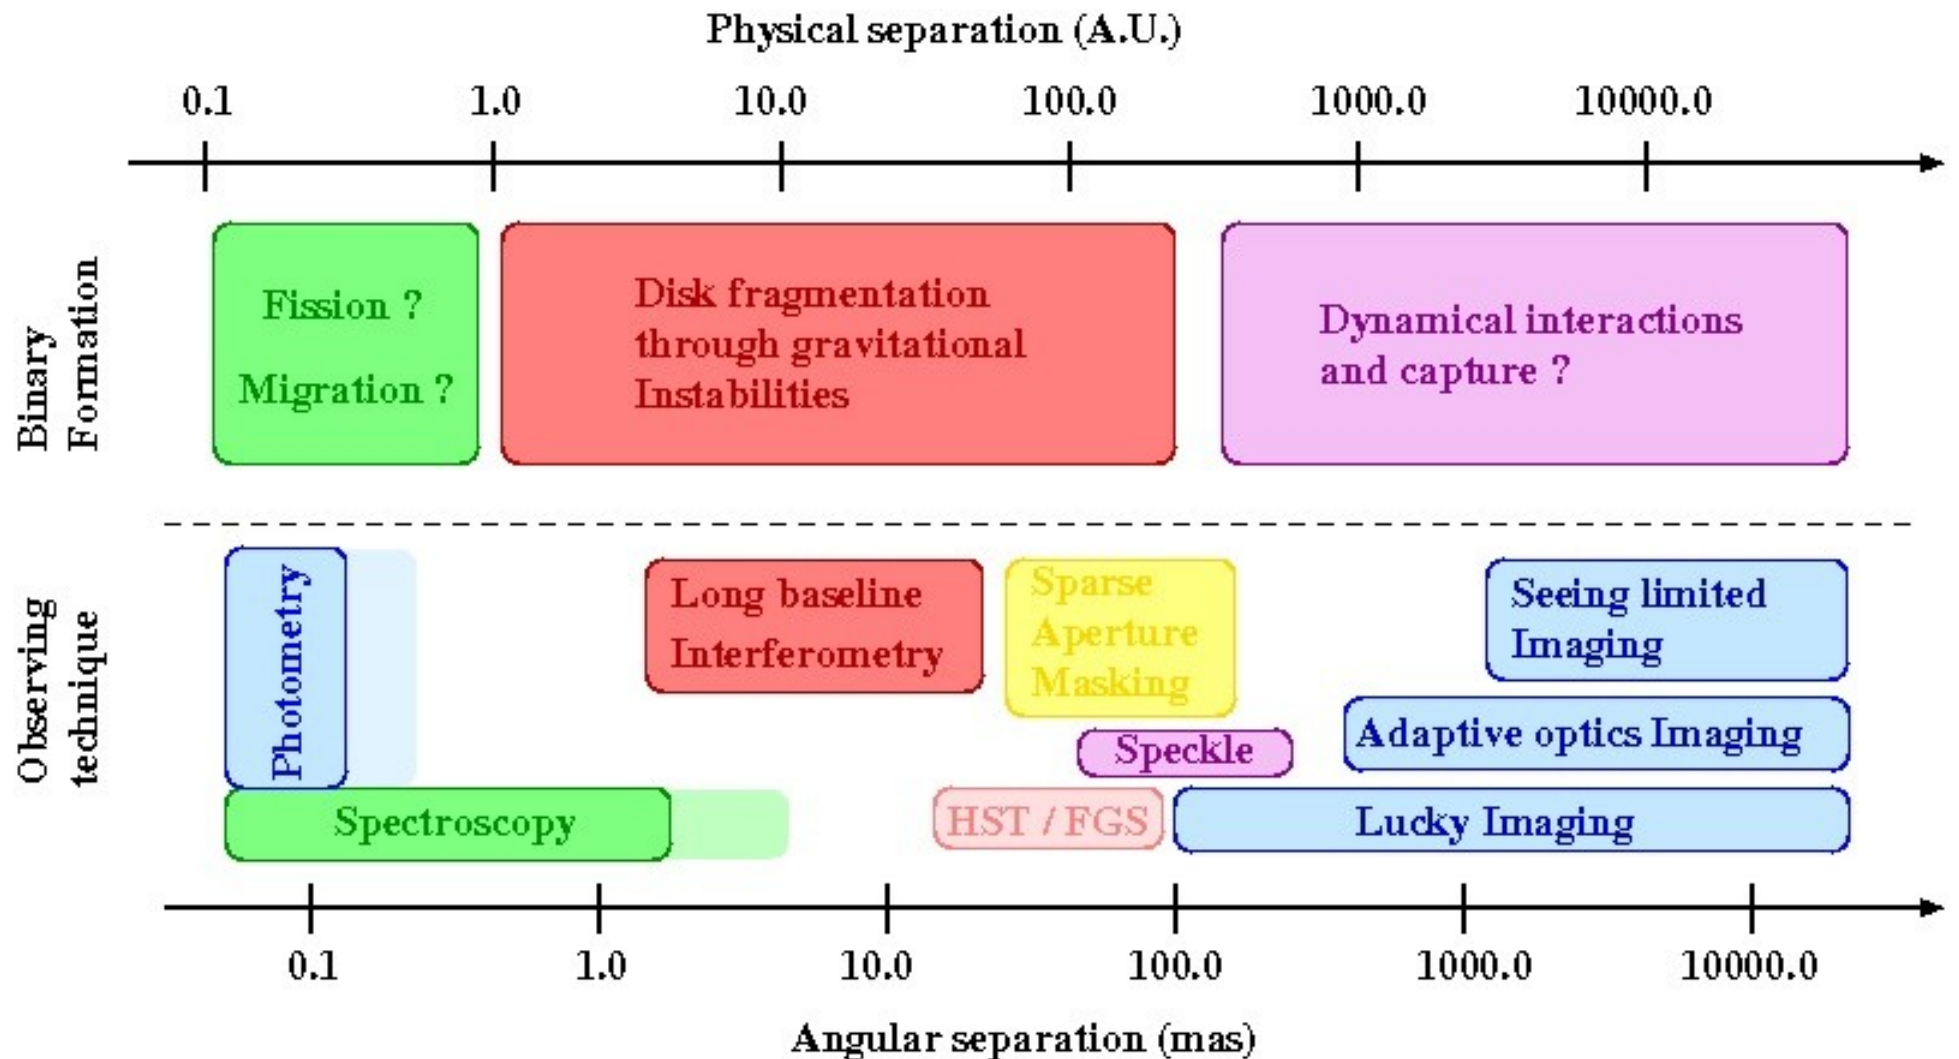

Thanks to the PIONIER team
for a wonderful instrument

Thanks to the VLTI team for great support

Backup slides
for
nasty questions

Preliminary results at half-course

Variety of pre-SN evolutionary products

- Mass & mass-loss
- Metallicity
- Rotation rate

Langer 2012

SMaSH+ sample
